TVS-31

THE VEGETABLE SITUATION

Summary

Generally smaller supplies of fresh vegetables and potatoes, and at least slightly improved demand conditions, are in prospect for the next several months compared with a year earlier, according to the Bureau of Agricultural Economics. As a result of this situation market prices of vegetables in the third week of July averaged slightly higher than in the corresponding period of 1938. Prices had declined seasonally, however, from those prevailing in late June.

In the current issue of the Vegetable Situation, the Bureau points out that the supply of intermediate potatoes is unusually short this season and market prices rose sharply in early July. This was a contra-seasonal movement in prices and has maintained the averages substantially above the relatively low levels of a year earlier. The potato crop in the late States, which begin to market heavily in late September, is slightly larger than in 1938 but below the recent 10-year average.

Production of sweetpotatoes is indicated to be about 3 percent larger than in 1938. Marketings of the new crop are just getting started as those of the old crop are finishing and prices averaged substantially higher than a year earlier.

Summer supplies of truck crops for fresh market are indicated to be generally smaller than last year, despite a slightly larger planted acreage.

Growing conditions for many vegetables have been unfavorable until recently when rains resulted in considerable improvement. Although market prices of a number of these crops in the third week in July were slightly lower than a year earlier, the general level appears to be slightly higher.

The prospect for truck crops for canning or manufacture indicates smaller crops generally. The reductions are due largely to sharply reduced planted acreages but in some instances yields per acre are expected to be smaller also. In view of the large carry-over stocks of most canned vegetables, however, it appears that total supplies will be ample for average consumption in 1939-40.

A sharp reduction in production of dry beans is in prospect this season but relatively large carry-over stocks are expected to maintain the total supply well in line with average disappearance for the last few years.

POTATOES

The supply of potatoes available for the late summer months is indicated to be considerably smaller than a year earlier and demand conditions for the period are expected to average somewhat higher. As a result of this situation market prices of potatoes, although fluctuating widely in recent weeks, have held to substantially higher levels than in the early summer of 1938.

Production in both the commercial and non-commercial areas of the intermediate States this season is indicated to be sharply lower than a year ago. Commercial production in the 2 intermediate groups combined totals only 16.4 million bushels, against 21.7 million last year and the 1928-37 average of 20.7 million bushels. Besides the production in these areas, a number of late States market early maturing varieties during the summer months but no definite information is available as to the size of this part of the late crop. Total production in many of these late States is indicated to be smaller than last year. In New England, however, the crop is somewhat larger.

Production in the 30 late States (excluding the California early crop) is indicated to total 291 million bushels, or about 4 million more than in 1938 but 9.5 million less than the recent 10-year average. The total late

and intermediate crop, which constitutes the principal source of market supplies for the next 9 months, is slightly smaller than a year earlier and about 5 percent smaller than the 1928-37 average. The late crop this season is indicated to be larger than last year in the 8 eastern States, but smaller in the 10 central and 12 western States, (excluding California early). The supply is below average in all 3 groups. Growing conditions in most northeastern and north central States and in Washington and Oregon have been favorable but in Idaho and Colorado the development of the crop has been retarded by cool dry weather. Since the first of July relatively high temperatures and insufficient rainfall have been reported for the northeastern States.

The weekly carlot movement of potatoes has decreased sharply in recent weeks, partly because of seasonal factors and partly because of the sharp reduction in production in the intermediate States. Usually the source of market supplies for this period of the year shifts to those areas which ship largely by motor-truck, and the rail and boat movement subsides until early September when marketings of the major late States attain volume. In the week ended July 22 the carlot movement totaled 1,700 cars compared with 5,100 cars a month earlier, and 2,326 cars a year earlier.

SWEETPOTATOES

Production of sweetpotatoes in 1939 is indicated to total 78.9 million bushels or about 3 percent more than was produced in 1938 and 12 percent more than the average for the last 10 years. The larger crop this season is due in part to a slightly larger acreage for harvest and in part to slightly higher indicated yield per acre. Sweetpotato prospects are greatly improved over last year's short crop in the 4 Central Atlantic Coast States and are improved slightly in the 8 South Central States. In the first area sweetpotatoes are grown largely for the commercial market, whereas, in the second group they are produced largely for food and feed within that area although in recent years a number of these States have been producing increasing quantities for the commercial market. Production in 1939 is larger than the recent 10-year average in every area except the 4 Central Atlantic Coast States and indicates rather plentiful supplies for the 1939-40 marketing and consuming period for all the Southeastern, Central and Western States.

Usually marketings of the old crop end and those of the new crop begin in July. This season a few cars of new crop sweetpotatoes were shipped in the week ended July 1 and the weekly rate had reached 62 cars by the week ended July 22. During this same period shipments of old stock dwindled to only a few scattered cars. Alabama, Florida and Louisiana were supplying most of the new stock.

TRUCK CROPS FOR MARKET

Lima beans: Production of lima beans in the second section of intermediate States is indicated to total 321,000 bushels or about 22 percent more than was produced in this area last year. Most of the increase occurred

in New Jersey where yields are expected to be good. Shipments of lima beans at this season of the year are largely by motor truck and, therefore, it is difficult to determine the volume of current marketings. Market prices advanced sharply in late June and early July but lost most of the advance by the third week of the month. They averaged slightly above those of a year earlier.

Snap beans: Production in the third section of intermediate States indicated at 676,000 bushels is only slightly smaller than last year but because of the increased competition from home and market garden supplies market prices of snap beans in the third week of July were sharply lower than a month earlier but were slightly higher than a year ago.

Cabbage: The decrease in the planted acreage of domestic cabbage in the late States from that in 1938 was even greater than earlier intention reports indicated. The reduction was 16 percent to 38,960 acres for the country as a whole with every State except Oregon sharing in the decrease. Dry weather retarded the development of the crop in some States early in the season but late June rains have improved conditions materially. The late domestic crop is the source of both the fresh market supply and a large proportion of the annual kraut pack. Fresh market shipment from the area usually begins in August. Current marketings are largely from the intermediate crop and market garden areas. Market prices in the third week of July averaged higher than both a month and a year earlier.

Cantaloupes: Owing to a slight increase in the planted acreage and a sharp increase in yields this year over 1938 the production of cantaloupes in the intermediate States totals 2.5 million crates or about 39 percent more than last year. It is nearly one-fifth larger than the 1928-37 average production for the area. The carlot movement of the early and second early crop has been progressing rapidly and in the third week of July was somewhat ahead of last year. Market prices of cantaloupes declined slightly during the first part of July but regained most of the loss in the third week when they averaged slightly lower than a year earlier. Prices of honeydews and honey balls declined seasonally during the early part of the month and the latter averaged lower than a year earlier in the third week.

Celery: The intermediate crop is indicated to total 1,350,000 crates (2/3 size) or about 8 percent more than was produced in this area in 1938 and 30 percent more than the recent 10-year average. Michigan shipments started earlier than usual this season with excellent quality while in New Jersey the intermediate crop was retarded by drought and is running in small sizes. Market prices have declined in recent weeks but in the third week of July averaged somewhat above a year earlier. Considerable quantities of eastern and mid-western celery is being shipped by motor truck.

Cucumbers: Although the intermediate acreage was reduced from last year, sharply increased yields per acre indicate that production is slightly larger or 1,116,000 bushels. All of the increase, however, occurs in Maryland and New Jersey where recent rains have greatly benefited crop development. Marketings from these areas have already started but as usual the carlot

movement in late July was relatively small because of motor-truck shipments. Market prices have declined more than seasonally in recent weeks, presumably due to the large supplies coming from home and market garden areas this season. In the third week of July they averaged somewhat below those of a year earlier.

Planting of cucumbers in the 2 late States, Michigan and New York, are reported to be about 10 percent larger than in 1938.

Lettuce: Despite a sharp increase in the planted acreage in the first section of late States, production is indicated to be slightly smaller than last year, only 3,430,000 crates. The smaller crop this season is due to low yields in California and Colorado, the 2 most important States in the group from an acreage standpoint. In California the crop has suffered somewhat from "tip-burn" which has resulted in a high percentage of 6 dozen crates being produced. In Colorado quality is reported as excellent. Carlot shipments of lettuce in recent weeks, coming largely from California and New York, have been heavier than a year earlier and market prices of western crates declined sharply in the third week of July. As compared with a year earlier, market prices were generally lower.

Onions: Production in the second section of intermediate States totals 710,000 bags of 100 pounds against 837,000 bags in 1938. The crop is sharply reduced in New Jersey, Virginia, Kentucky and Iowa but increased in Oklahoma and Washington. Marketings from Iowa are about completed while those from Oklahoma are just starting. Some shipments are also being made from the relatively large first intermediate crop and from some of the late States. Market prices of onions in the third week of July were slightly higher than a month earlier but most varieties averaged slightly lower than a year ago.

Green peppers: Production in the intermediate States of New Jersey and North Carolina, is indicated to total 1,858,000 bushels this season or about 6 percent more than in 1938 and 17 percent more than the recent 10-year average. Because of heavy marketings in recent weeks, largely by motor truck, market prices have declined sharply, particularly in New York City where the average for the third week of July was below that of a year earlier.

TRUCK CROPS FOR MANUFACTURE

The total acreage planted to 10 important truck crops for canning and manufacture in 1939 is indicated to be about 23 percent less than in 1938 and 33 percent less than the record high acreage planted in 1937. Reductions are indicated for each crop, with lima beans off 13 percent; snap beans, beets, sweet corn and cucumbers for pickles about 1/3; cabbage for kraut, 8 percent; green peas, 24 percent; pimientos, 14 percent; spinach, 22 percent; and tomatoes, 11 percent. The sharp decreases in acreage this season are due largely to the low level of prices for canned vegetables prevailing last season and to the relatively large supply of most of these

products available and expected to be carried over into the 1939-40 marketing season. Stocks of 6 of the important canned vegetables as of July 1 (June 1 for peas and California tomatoes) totaled 22.7 million cases, all size cans, as compared with 16.2 million cases of these same products a year earlier and about 6.3 million cases 2 years ago. Current stocks represent a little over one-fifth of the average annual disappearance of the last 2 seasons when prices were at relatively low levels.

Information concerning production is available for only snap beans, green peas and spinach. In the case of snap beans, production is indicated to be about one-third smaller than last year while that for green peas is down about 36 percent. Spinach production is indicated to be increased slightly. For the other important crops reports as of July 15 indicate that condition for lima beans and sweet corn was slightly higher than last year but slightly lower for beets, cabbage for kraut, cucumbers for pickles and pimientos.

DRY BEANS

Production of dry beans for 1939 is indicated to total 11.9 million bags of 100 pounds or about 22 percent less than the large crop produced in 1938 and 6 percent below the recent 10-year average. The smaller crop this season is due both to a reduced acreage remaining for harvest and to smaller indicated yields per acre.

On the basis of July 1 condition production is indicated to be smaller than last year in each of the major producing areas. In the area producing largely pea beans but also the major source of kidney beans, the total crop is about 23 percent smaller than in 1938. In the group of States producing largely Great Northerns production is indicated to be decreased 15 percent while the reduction in the Pinto area is 43 percent and in California, 14 percent. In Idaho which is an important source of both Great Northerns and Small Reds, production is down 14 percent from last year.

Although only incomplete information is available at this time concerning the stocks of old crop beans, the large total supply available for the 1938-39 season and relatively low prices prevailing during recent weeks would indicate that the carry-over at the end of the season probably will be unusually large but probably no larger than it was last season. Carry-over stocks are likely to be larger than last year in California and Idaho but smaller in other important areas. Last year's supply of 17.5 million bags, composed of 2.2 million bags carry-over, and 15.3 million bags new crop, was the largest on record. If the carry-over in 1939 is about the same as in 1938 the total supply for the 1939-40 season would be about 14.1 million bags or nearly one-fifth smaller than in 1938-39. Another favorable factor in the market situation for this year's crop is the prospect for somewhat better demand conditions in 1939-40 than prevailed in 1938-39.

Truck crops: Commercial acreage and production for market, average 1928-37, annual 1938 and indicated 1939 as reported to July 21, 1939-continued

Commodity and group	Acreage			Unit	Production		
	10-year	1938	1939		10-year	1938	1939
	average				average		
	1928-37				1928-37		
	Acres	Acres	Acres				
Total acreage planted and in- tended as report- ed to July 21	1,464,760	1,645,600	1,669,990				
Total acreage, in- termediate and late, as report- ed to July 21 5/	659,850	729,330	742,620				

- 1/ Included undetermined quantities of production used for manufacture, frozen pack, etc.
- 2/ Estimates for Texas have been revised to an actual acreage basis as contrasted with earlier reports which took into account difference in widths of rows.
- 3/ Not included in totals.
- 4/ New Jersey is excluded from intermediate group total because the tomato crop there is very late this season. Production estimate not yet available.
- 5/ Excludes late asparagus but includes second early watermelons.

* Intended.
